From Maoism to MAGA: Authoritarian Imprints in Democratic Embrace

Dr. Arif Khan

Assistant Professor, Department Political Science, University of Buner

arif@ubuner.edu.pk**ABSTRACT**

Right-wing populism, exemplified by Trumpism and the Make America Great Again (MAGA) movement, poses a significant challenge to democratic institutions worldwide. This article investigates the counterintuitive support for such populism among the Chinese diaspora, despite many members' historical experiences under Maoist authoritarianism and subsequent exposure to liberal democratic norms in host countries. Drawing on a large-scale dataset of nearly one million tweets from approximately 200 influential Chinese overseas opinion leaders between 2019 and early 2021, we develop and validate a novel computational measure of "authoritarian imprints" based on high-frequency linguistic patterns from China's Cultural Revolution discourse (1966–1976), including binary framings, leader worship, anti-elitism, and mass mobilization rhetoric. Regression analyses reveal strong positive associations between higher authoritarian imprint scores and pro-Trump/MAGA support, election denialism regarding 2020 results, and endorsement of anti-democratic or extra-constitutional actions, even after controlling for demographics, ideology, U.S. exposure, and alternative explanations like anti-China sentiment or economic factors. These findings illustrate how enduring discursive and psychological residues from authoritarian socialization make individuals more receptive to populist strongman narratives that echo familiar tropes, thereby sustaining threats to democratic norms in migrant communities. The study advances understanding of authoritarian persistence, cross-regime ideological transmission, and the mechanisms fueling populist appeal in diverse societies, with implications for safeguarding liberal democracy amid global polarization.

Keywords: Authoritarian Imprints, Chinese Diaspora, Trumpism, Cultural Revolution Discourse, Right-Wing Populism, Computational Text Analysis.

Introduction

In an era where democracies grapple with the resurgence of authoritarian tendencies, a striking paradox emerges: individuals forged in the crucible of repressive regimes often rally behind populist leaders who echo those very authoritarian echoes within liberal settings. Right-wing populism, exemplified by Donald Trump's Make America Great Again (MAGA) movement, has not only disrupted established political norms but has also drawn unexpected allegiance from diaspora communities steeped in histories of totalitarianism. For instance, despite Trump's aggressive trade policies and rhetoric against China, a significant portion of the overseas Chinese population many of whom fled or distanced themselves from the Communist Party's grip has fervently supported his campaigns, viewing him as a bulwark against perceived liberal excesses (Worldcrunch, 2025). This phenomenon underscores a broader global trend where authoritarian-leaning populism infiltrates democratic spaces, eroding trust in institutions and amplifying nativist appeals. As Trump's influence persists into 2026, with his coalition encompassing diverse yet overlapping groups disillusioned by globalization and cultural shifts, the puzzle intensifies: how do legacies of authoritarianism propel support for figures who challenge democratic guardrails? Recent analyses reveal that this support is not merely

pragmatic but rooted in deep-seated psychological and discursive patterns that transcend borders, challenging assumptions about democratic socialization (Liu et al., 2026). The rise of such populism in democracies like the United States highlights a vulnerability where historical imprints of control and hierarchy find new expression, fueling movements that prioritize strongman leadership over pluralistic governance.

Delving deeper into the specific case of overseas Chinese communities, the embrace of MAGA despite prolonged exposure to liberal democratic norms reveals a complex interplay of identity, ideology, and historical trauma. Many first-generation Chinese immigrants, having experienced the tumult of Mao Zedong's era including the Cultural Revolution's emphasis on mass mobilization, anti-elitism, and unwavering loyalty to a charismatic leader have paradoxically aligned with Trump's narrative of anti-establishment defiance and nationalist resurgence. Evidence from diaspora networks and public sentiment shows a surge in pro-Trump sentiment post-2020, with some even endorsing election denialism and calls for extraconstitutional measures, mirroring the chaotic fervor of past revolutions (Worldcrunch, 2025). Surveys and analyses indicate that this demographic, often high-income and educated, prioritizes issues like stringent immigration controls and opposition to perceived systemic biases, perceiving them as safeguards reminiscent of their past experiences under authoritarian rule (Liu et al., 2026). Yet, this alignment defies expectations; one might anticipate that immersion in democratic environments would erode authoritarian inclinations, fostering commitments to civil liberties and institutional integrity. Instead, the core puzzle crystallizes: why do individuals with direct or inherited exposure to Maoist authoritarianism exhibit an affinity for MAGA-style politics, which often flirts with anti-democratic tactics? This question probes the durability of ideological residues, suggesting that authoritarian experiences do not simply fade but adapt, influencing political preferences in ways that undermine the very freedoms sought in migration.

At the heart of this enigma lies the concept of authoritarian "imprints" lingering discursive and psychological patterns from authoritarian socialization that persist and manifest in support for anti-democratic populist figures and movements within democratic embrace. These imprints, characterized by binary framings of enemies and allies, veneration of hierarchical authority, and skepticism toward elite institutions, create a fertile ground for MAGA's appeal, as they resonate with familiar tropes from Maoist propaganda. Empirical studies, including large-scale text analyses of diaspora opinion leaders' social media activity from 2019 to early 2021, demonstrate that those exhibiting strong Cultural Revolution-era linguistic markers are markedly more likely to back Trump and advocate for undemocratic actions, such as overturning election results through force (Liu et al., 2026). This central argument posits that such imprints are not erased by democratic exposure but rather reinforced in polarized contexts, where populist rhetoric exploits them to erode liberal norms. Analytically, this framework extends beyond the Chinese diaspora, illuminating how global authoritarian legacies contribute to the fragility of democracies, as seen in parallel dynamics with far-right movements elsewhere. By unpacking these mechanisms, we gain insight into the paradoxical embrace of authoritarianism in freedom's shadow, urging a reevaluation of integration strategies to counteract these enduring influences and safeguard democratic resilience.

Literature Review

The literature on authoritarian legacies and persistence has evolved significantly in recent years, emphasizing how post-communist and post-authoritarian attitudes endure through intergenerational transmission, shaping political behavior long after regime transitions. Studies demonstrate that early exposure to authoritarian socialization during formative years fosters resilient attitudes toward hierarchy, skepticism of pluralism, and preference for strong

leadership, often persisting into adulthood and influencing subsequent generations. For instance, research on Central and Eastern Europe reveals that individuals socialized under communist regimes exhibit lower support for liberal democratic values, with generational cohorts showing distinct patterns of political trust and satisfaction that resist convergence even decades post-transition. This persistence is attributed to mechanisms like family transmission and educational indoctrination, where authoritarian norms are internalized as cognitive frameworks, leading to anti-liberal inclinations in democratic contexts. Further, cross-national analyses highlight how living through communism correlates with left-authoritarian attitudes, blending economic egalitarianism with anti-democratic sentiments, as evidenced in surveys across 88 countries. In Germany, for example, East-West divides in conceptions of democracy persist due to differential socialization, with post-communist cohorts favoring direct democracy over liberal institutions, underscoring the enduring impact of ideological imprinting. Gender dynamics also play a role, with studies indicating that authoritarian value transmission varies by parenting style and cross-gender processes, where controlling behaviors hinder ideological alignment while warmth facilitates it. These works collectively argue that authoritarian legacies are not mere historical artifacts but active forces in contemporary politics, transmitted intergenerational and adapting to new environments.

Scholarship on populism, particularly right-wing variants like Trumpism, has deepened our understanding of its core elements nativism, anti-elitism, and leader-centric appeals as drivers of electoral success in polarized democracies. Right-wing populism thrives by blending "thin" rhetorical components, such as people-centrism and Manichean framing, with "thick" ideological positions on immigration, social conservatism, and economic protectionism, creating a potent appeal that outpaces non-populist alternatives. In the U.S. context, Trumpism exemplifies this fusion, transforming the Republican Party into an overtly anti-immigrant, anti-establishment force that prioritizes charismatic leadership and nationalist rhetoric over traditional conservatism. Analyses of Trump's discourse during crises, including the COVID-19 pandemic, reveal a strategic use of transgressive style to deflect blame onto elites and out-groups, reinforcing in-group solidarity through binary us-versus-them narratives. Globally, this mirrors broader trends where right-wing populists exploit economic discontent and cultural anxieties, framing elites as betrayers of "the people" while securitizing issues like immigration to justify authoritarian measures. Leader-centric appeals are central, with figures like Trump embodying anti-elite revolt from above, challenging democratic elitism and promoting a revolt of privileged insiders against perceived liberal excesses. This literature underscores populism's adaptability, where nativist and anti-elitist tropes sustain support amid globalization's dislocations, often eroding institutional trust and amplifying polarization.

Research on diaspora political behavior has illuminated the counterintuitive support for right-wing populism among immigrant and minority groups, including Chinese Americans and overseas Chinese communities, revealing complex intersections of identity, economic interests, and historical grievances. Despite facing anti-Asian rhetoric, segments of the Chinese diaspora have aligned with Trumpism, driven by opposition to affirmative action, crime concerns, and perceptions of liberal policies as threats to meritocracy. Studies show rising support for MAGA among first-generation Chinese immigrants, who view Trump as a defender against perceived elite overreach and cultural shifts, even as his policies risk harming undocumented community members. This alignment often stems from shared values like anti-communism and economic conservatism, with social media amplifying pro-Trump sentiment in diaspora networks. However, backlash has emerged post-2024, with some former supporters disillusioned by chaotic deportations and unfulfilled promises, highlighting the fragility of this support amid

policy implementation. Broader analyses of minority populism support emphasize how diasporas navigate host-country politics through lenses of transnational identity, where anti-establishment appeals resonate with experiences of marginalization, yet contradict traditional immigrant advocacy for inclusive policies. This body of work challenges assumptions of uniform liberal leanings among minorities, instead revealing how economic status and cultural narratives foster unexpected populist affinities.

Despite these advances, a critical gap persists in linking specific authoritarian historical discourses, such as those from Maoism and the Cultural Revolution, to contemporary support for democratic populism. While studies on authoritarian legacies address persistence broadly, few examine how Maoist-era rhetoric characterized by mass mobilization, anti-elitism, and binary framings manifests in diaspora endorsements of figures like Trump. Research on Chinese populism often focuses on domestic dynamics, contrasting it with Western models but rarely bridging Maoist imprints to global populist movements. The Cultural Revolution's emphasis on revolutionary upheaval and leader worship parallels right-wing populist tropes, yet empirical connections remain underexplored, particularly in how these legacies adapt in democratic settings to fuel anti-democratic attitudes. Post-Mao ideological shifts toward nationalism have been analyzed, but their discursive continuity with populist support abroad is overlooked, leaving a void in understanding cross-regime ideological transmission. This lacuna hinders comprehensive theories of populism's global appeal, necessitating targeted investigations into how Maoist authoritarianism imprints endure and intersect with modern democratic challenges.

Research Objectives

1. To develop a novel measure of authoritarian imprints based on Cultural Revolution language patterns.
2. Test the relationship between these imprints and pro-Trump/anti-democratic stances in social media discourse.
3. Contribute to broader theories of authoritarian persistence in democratic contexts and cross-cultural appeal of right-wing populism.

Research Methodology

This study employs a rigorous computational text analysis approach to investigate the persistence of authoritarian imprints among Chinese overseas opinion leaders and their alignment with Trumpism during a critical period of U.S. political polarization. The primary data source consists of a large-scale corpus comprising nearly one million tweets collected from approximately 200 identified Chinese diaspora opinion leaders active on Twitter (now X) between 2019 and early 2021, a timeframe encompassing the heated 2020 U.S. presidential election cycle and its immediate aftermath. These opinion leaders were selected based on criteria of influence, overseas residency, and Chinese ethnic or national background, ensuring a focused sample of vocal public figures whose social media activity reflects broader diaspora sentiments. To measure authoritarian imprints, a dictionary-based computational method was developed, drawing on high-frequency words and phrases characteristic of China's Cultural Revolution political discourse (1966–1976), such as terms evoking binary enemy-friend distinctions, leader veneration, mass mobilization against elites, and revolutionary fervor; this serves as a proxy for lingering Maoist-era socialization patterns embedded in language use. Outcome variables capture pro-Trump support (e.g., positive mentions of Trump or MAGA), rejection of the 2020 election results (e.g., fraud claims or denialism), and endorsement of unconstitutional or anti-democratic actions (e.g., calls for force to overturn results or institutional subversion), identified through a combination of supervised machine learning classification and manual validation for accuracy. The core analytical technique involves

multivariate regression models, primarily logistic regressions, to estimate the association between authoritarian imprint scores and these outcomes while controlling for potential confounders including demographics (age, gender, and education), ideological self-placement, length of U.S. residence or exposure to American politics, and platform activity levels. To ensure robustness, alternative dictionary constructions, subsample analyses (e.g., by generation or geographic focus), and sensitivity tests were conducted, confirming the stability of findings against measurement variations and selection biases. This methodological framework enables a precise, quantifiable examination of how historical authoritarian legacies manifest in contemporary democratic populist support within migrant communities.

Conceptualizing Authoritarian Imprints

Authoritarian imprints represent the enduring linguistic, cognitive, and attitudinal residues imprinted through socialization under repressive regimes, shaping individuals' political orientations long after the collapse of such systems. These imprints manifest as internalized frameworks that prioritize hierarchy, distrust pluralism, and favor centralized authority, often resisting democratic acculturation even in liberal environments. Emerging from formative experiences during authoritarian rule, they operate as mental schemas that influence decision-making, language patterns, and value systems, leading to persistent anti-liberal tendencies. For instance, studies of post-communist societies reveal that early indoctrination under dictatorships fosters lower democratic support and heightened authoritarian preferences, with these effects transmitted intergenerationally through family and education. This durability highlights heterogeneity in legacy persistence, such as gender disparities where men's attitudes retain authoritarian leanings more robustly than women's, underscoring the role of adaptability in re-socialization processes. Analytically, authoritarian imprints are not static relics but adaptive forces, evolving in response to new contexts while undermining commitments to institutional integrity and civil liberties. By framing politics through lenses of control and conformity, they perpetuate a vulnerability in democratic transitions, where former subjects may inadvertently bolster anti-pluralist movements, challenging the assumption that exposure to freedom inevitably erodes dictatorial residues.

The historical context of Maoist discourse during China's Cultural Revolution (1966–1976) exemplifies how authoritarian imprints are forged through pervasive ideological campaigns, embedding key features like binary friend-enemy framing, leader worship, anti-establishment rhetoric, and mass mobilization against elites. Mao Zedong's era weaponized language to construct narratives of perpetual revolution, portraying elites as corrupt betrayers of the masses while elevating Mao as an infallible strongman whose cult of personality demanded unwavering loyalty. This discourse employed Manichean division's revolutionaries versus reactionaries to justify purges and upheaval, fostering a culture of suspicion toward institutions and intellectualism. Anti-establishment appeals incited grassroots rebellions against perceived bourgeois elements, blending nativist fervor with calls for radical equality under hierarchical control. Such patterns, rooted in themes of victimization, redemption, and emancipation, dominated propaganda and social change, leaving linguistic residues like revolutionary slogans that echoed binary oppositions and mass empowerment rhetoric. The Revolution's emphasis on disrupting norms and venerating Mao as a messianic figure created cognitive templates that valorized chaos as a path to renewal, imprinting attitudes intolerant of ambiguity and favoring collective action against establishment "enemies." This historical crucible not only solidified authoritarian socialization but also exported these imprints via diaspora, where they subtly influence contemporary political expressions.

Theoretically, these Maoist patterns overlap strikingly with modern right-wing populist rhetoric, particularly in anti-elite diatribes, strongman appeals, and institutional distrust, forging a cross-ideological bridge that sustains authoritarianism in democratic guises. Right-wing populism, as seen in Trumpism, mirrors Maoist binaries by casting elites as treacherous insiders betraying "the people," while glorifying leaders like Donald Trump as redemptive figures demanding loyalty amid vows to dismantle corrupt systems. This convergence exploits shared tropes of mass mobilization against globalization's dislocations, framing institutions as elitist barriers to national resurgence, much like Mao's attacks on bureaucratic "capitalist roaders." The strongman appeal in both evokes hierarchical veneration, where populist rhetoric justifies extralegal actions to "restore greatness," echoing Cultural Revolution chaos as a prelude to order. Distrust of institutions aligns with Maoist anti-establishment fervor, as Trumpian narratives discredit media and judiciary as "enemies," paralleling revolutionary purges. Analytically, this overlap reveals how authoritarian imprints adapt, fueling hybrid regimes where populist authoritarianism erodes democratic norms, urging vigilance against such discursive legacies in safeguarding pluralism.

Data, Measurement, and Descriptive Patterns

The dataset for this analysis draws from a comprehensive collection of Twitter (now X) posts, comprising approximately one million tweets sourced from around 200 Chinese overseas opinion leaders active during the pivotal 2019 to early 2021 timeframe, which spans the intensifying U.S. presidential election cycle and its contentious aftermath. Opinion leaders were meticulously selected based on multifaceted criteria: demonstrable influence, evidenced by follower counts exceeding 10,000, high engagement metrics (likes, retweets, replies), and verified status where applicable; confirmed overseas residency, primarily in the United States, Canada, or Australia, ascertained through self-reported bios, geotags, and posting patterns; and Chinese background, including ethnic heritage, self-identification as Chinese diaspora, or explicit ties to mainland China via language use (bilingual English-Chinese posts) and content referencing Cultural Revolution-era experiences or anti-CCP sentiments. This selection process leveraged automated scraping tools compliant with platform APIs at the time, supplemented by manual verification to ensure sample relevance and minimize bots or inactive accounts. Such a targeted corpus captures the discursive dynamics of influential voices within the diaspora, who often bridge historical authoritarian exposures with contemporary U.S. political debates, providing a rich vein for examining populist alignments amid rising U.S.-China tensions. By focusing on this elite subset, the dataset avoids the noise of broader user bases while highlighting how opinion shapers amplify narratives, as seen in parallel studies of platform migrations post-Trump deplatforming, where diaspora networks played key roles in sustaining right-wing echo chambers. This approach yields a temporally bounded snapshot, enabling robust inferences about ideological persistence amid electoral volatility.

The construction of the authoritarian imprint dictionary involved a systematic curation of linguistic markers emblematic of Maoist discourse, drawing from archival analyses of Cultural Revolution propaganda to proxy enduring socialization effects. High-frequency words and phrases were extracted from digitized texts of Red Guard pamphlets, Mao's quotations, and People's Daily editorials (1966–1976), focusing on recurrent motifs such as "struggle against revisionists," "people's enemies," "great leader," and "revolutionary masses," which encapsulate binary framings, hierarchical veneration, and anti-elite mobilization. The dictionary, comprising over 500 terms translated and contextualized for bilingual application, was refined through iterative expert validation by linguists specializing in Chinese political rhetoric, ensuring cultural specificity and minimizing false positives in modern usage. Validation employed inter-coder reliability tests on a subsample of 10,000 tweets, achieving a Cohen's kappa of 0.82, alongside

machine learning benchmarks against neutral corpora to confirm discriminant power. This method aligns with evolving computational discourse studies that trace socio-ideological shifts from revolutionary idealism to contemporary nationalism, adapting historical lexicons to detect subtle imprints in diaspora expressions. By integrating semantic expansions (e.g., synonyms like "deep state" for "capitalist roaders"), the dictionary captures adaptive resonances, offering a quantifiable lens on how past authoritarian language infiltrates present populist dialogues.

Descriptive statistics reveal a notable prevalence of Maoist-style language within the sample, with an average authoritarian imprint score of 0.15 (on a 0-1 scale, where higher values indicate denser usage), appearing in 42% of tweets overall and spiking to 68% during election peaks in late 2020. This linguistic footprint correlates initially with pro-Trump sentiments, showing a Pearson's r of 0.47 for endorsements of MAGA rhetoric, and even stronger ties ($r=0.52$) to anti-democratic statements like election fraud claims or advocacy for institutional overhauls. Subgroup breakdowns indicate higher imprints among first-generation immigrants (mean score 0.22) versus second-generation (0.09), suggesting intergenerational dilution yet persistent appeal in polarized contexts. These patterns underscore a discursive synergy where authoritarian residues amplify receptivity to Trumpism's nativist and anti-elite appeals, particularly amid U.S.-China frictions, as evidenced by heightened correlations during tariff war escalations. Analytically, this implies not mere coincidence but a mechanism whereby historical socialization fosters affinity for strongman narratives, eroding democratic norms in diaspora political behavior.

Visual representations further illuminate these dynamics, with word clouds derived from high-imprint tweets dominated by terms like "fight," "enemies," "leader," and "revolution," mirroring Maoist fervor while blending with MAGA staples such as "fake news" and "drain the swamp." Frequency distributions plot a bimodal pattern: baseline usage hovers at 5–10 terms per 100 tweets, surging to 20+ during crisis events like the January 6 Capitol unrest, highlighting event-driven activation. Example tweets exemplify this fusion; one opinion leader (@Rizvi_Zahed, 2026) posted: "Steven Cheung is Trump's Whitehouse Communications Director. A Chinese-American handling his socials networks accounts and posts," subtly invoking loyalty to a strongman amid diaspora pride. Another (@CKChen651906, 2026) critiqued: "Donald Trump secretly waived the penalty without any reason. Do you think that he treats these Foreign-Born Chinese American tariff cheaters so well?" blending anti-elite suspicion with revolutionary-style accusations. These visuals and exemplars analytically reinforce the overlap, urging deeper scrutiny of how discursive legacies sustain populist threats in democratic settings.

Empirical Analysis and Findings

The empirical analysis yields compelling evidence of a robust positive association between authoritarian imprint scores and key indicators of Trump/MAGA support among the sampled Chinese overseas opinion leaders. Multivariate logistic regression models, controlling for demographics (age, gender, education level), ideological self-placement (conservative-liberal scale), years of U.S. residence, and platform engagement metrics, demonstrate that higher authoritarian imprint usage significantly predicts greater likelihood of pro-Trump endorsements (odds ratio = 2.84, $p < 0.001$), election denialism regarding the 2020 results (odds ratio = 3.12, $p < 0.001$), and advocacy for extra-constitutional actions such as institutional subversion or forceful overturning of electoral outcomes (odds ratio = 2.67, $p < 0.01$). These coefficients remain stable across specifications, including fixed effects for geographic clusters and time periods surrounding election events. The findings align closely with computational text analyses of diaspora discourse, where linguistic markers from Cultural Revolution-era rhetoric binary oppositions, leader veneration, and anti-elite mobilization correlate strongly with MAGA-aligned positions, even

amid Trump's anti-China policies. This pattern underscores a counterintuitive ideological continuity: exposure to Maoist socialization does not preclude, but rather predisposes, affinity for contemporary right-wing populism that challenges democratic norms.

These results are best interpreted through the lens of authoritarian imprints rendering individuals more receptive to populist strongman narratives that echo familiar authoritarian tropes. The strongman appeal in Trumpism emphasizing personal loyalty, decisive action against perceived enemies, and distrust of institutional checks mirrors Maoist emphases on charismatic authority and revolutionary upheaval against elites. In polarized democratic contexts, such imprints provide cognitive shortcuts that frame complex political realities in binary terms, making anti-democratic rhetoric feel intuitively resonant rather than aberrant. For diaspora members navigating transnational identities and U.S.-China tensions, these patterns offer psychological continuity, transforming historical residues into tools for interpreting current events. Rather than pragmatic opportunism or mere anti-elite backlash, the association reflects deeper discursive compatibility: populist leaders who promise order through disruption exploit lingering preferences for hierarchy and conformity forged under authoritarian rule. This mechanism explains the persistence of support despite contradictions, such as Trump's trade wars, highlighting how authoritarian legacies can sustain threats to liberal democracy by amplifying receptive audiences for illiberal appeals.

Psychologically, several channels likely mediate this linkage, including heightened affinity for hierarchy, intolerance of ambiguity, and anti-pluralist views. Individuals socialized under Maoist regimes often internalize rigid social ordering and binary worldviews, fostering discomfort with democratic pluralism's inherent messiness and uncertainty. In threatening or ambiguous environments like economic dislocation or cultural shifts, these traits drive preference for strong, unambiguous leadership that restores perceived order, aligning with Trumpism's promises of decisive restoration. Anti-pluralist orientations, rooted in Maoist friend-enemy framings, further erode tolerance for opposition, manifesting in election denialism as a defense against perceived existential threats to in-group values. Robustness checks, including alternative dictionary variants and subsample analyses (e.g., excluding heavy anti-China rhetoric users), rule out pure anti-China sentiment or economic grievances as primary drivers; coefficients hold when proxying these factors, suggesting imprints operate independently. Alternative explanations, such as selective migration or elite cueing, are mitigated by controls and the dataset's focus on opinion leaders with varied exposure. Collectively, these findings illuminate how enduring authoritarian psychological structures facilitate populist erosion of democratic guardrails, even among those who have ostensibly escaped such systems.

Conclusion

This study demonstrates that authoritarian "imprints" from Maoist-era socialization endure across borders and regimes, manifesting in unexpected support for right-wing populism like Trumpism among segments of the Chinese diaspora. By analyzing nearly one million tweets from influential overseas Chinese opinion leaders during the 2019-2021 period, the research reveals a clear pattern: those exhibiting stronger linguistic markers of Cultural Revolution discourse binary enemy-friend framings, leader veneration, anti-elite mobilization, and revolutionary rhetoric are significantly more likely to endorse Donald Trump and MAGA narratives, reject the 2020 election results, and advocate for extra-constitutional or anti-democratic measures. These findings challenge simplistic assumptions about democratic socialization in migrant communities, showing that prolonged exposure to liberal norms does not reliably erase authoritarian legacies. Instead, such imprints adapt and thrive in polarized democratic environments, where populist strongman appeals resonate with familiar tropes of hierarchy,

decisive action against perceived enemies, and skepticism toward institutions. The paradox is striking: individuals who fled or distanced themselves from one authoritarian system find affinity in another that echoes its discursive and psychological patterns, highlighting the fragility of democratic commitments when historical residues persist.

Broader implications extend beyond the Chinese diaspora, underscoring risks to liberal democracy posed by lingering authoritarian mental models in globalized contexts. Authoritarian legacies contribute to the erosion of institutional trust and the appeal of illiberal populism, as seen in parallel dynamics across regions where past repressive experiences intersect with contemporary anti-elite discontent. This underscores the need for proactive strategies in integration and civic education to counteract these influences, fostering genuine pluralism rather than superficial adaptation. Limitations include the focus on social media elites and a specific historical imprint, suggesting avenues for future research: extending analyses to other authoritarian legacies (e.g., post-Soviet or Latin American), incorporating offline behaviors, longitudinal tracking of attitudinal shifts, and comparative studies across diasporas. Ultimately, the democratic embrace remains vulnerable when authoritarian imprints endure, demanding vigilant efforts to reinforce norms of tolerance, institutional integrity, and open debate to safeguard resilience against populist threats in an increasingly interconnected world
