naima.zubair.vt9910@iiu.edu.pk**ABSTRACT**

This qualitative study examines the subjective experiences of social integration among female students belonging to "nouveau modern" backgrounds at the International Islamic University Islamabad (IIUI). Employing a qualitative research strategy, the study examined how such students navigate identity, belonging, and social adjustment in a traditional academic environment. Based on in-depth interviews with 22 self-identified progressive/modern IIUI students, the study thematically coded data regarding peer relationships, cultural negotiation, symbolic consumption, and media influence. The research findings identify tension between social conformity to institutional standards and the articulation of real selves, with problems of class discrimination, peer exclusion, and social conformity to dominant cultural signifier such as dress, dress codes, language, and way of life. This study contributes to the ongoing debate about cultural hybridity, social conformity, and identity formation in Pakistani higher education, calling for academically diverse spaces that recognize and value socio-cultural diversity.

Keywords: Cultural Adaptation, Social Integration, Conformist, Code Switching, Hybrid Identity, Visual Modernity, Symbolic Consumption, Linguistic Blending.

Introduction***Kawwā chalā hans kī chāl, apnī chāl bhī bhūl gayā* (Urdu proverb)**

This proverb, translated as "The crow attempted to walk like a swan, but lost its own method of walking," encapsulates the profound idea that when individuals blindly emulate others without a solid understanding of themselves and the precise circumstances of their emulation, they not only fail to truly represent the emulated culture but also lose themselves in the process. This notion is particularly pertinent to the context of "nouveau modern" students at the International Islamic University Islamabad (IIUI), whose subjective experiences of social integration are the focus of this qualitative study.

The proliferating group of students from "nouveau modern" backgrounds, characterized by their recent upward socio-economic movement, offers a rich perspective through which to study the complex dynamic between changing socio-cultural expectations and the malleable construction of identity within the university environment. This study investigates the everyday experiences of such students to reveal an active negotiation of multiple dimensions of social integration, such as behavioral, physical appearance, and communication adaptations. We contend that these changes are not merely indexical performances of superficial assimilation but strategic interactions with an unfamiliar social space, motivated by a fundamental need for membership and the alleviation of perceived socio-economic

differences. But this search for integration is occasionally disrupted by experiences with persistent socio-economic prejudices and stereotypes, highlighting entrenched issues of inequality in the academic setting. In an effort to fully understand these processes, this research will consider social integration between IIUI's "nouveau modern" students and how they negotiate identity through appearance, language, and behavior.

Our study indicates that the construction of hybrid identities in these students is a creative mixing of heritage and global influences they get exposed to. Such negotiation of cultural displacement provides evidence for the growing interconnectedness of cultural landscapes and subverts essentialist accounts of identity, highlighting its fluid and dynamic character in an era of globalization. The symbolic consumption, and even visual markers of modernity and status, further illustrate how identity is affirmatively stated and negotiated through material goods and the inescapable presence of global media. Given this, the study further seeks to analyze how socio-economic status and peer networks influence these hybrid identities, and to examine how globalization and digital media contribute to their identity expressions.

Peer processes of network are essential, though complex, to "nouveau modern" students' social integration and identity formation. Shared lifestyle ideals can create social bonding, but also inadvertently result in exclusion from peers who are not adhering to the newest trends. This highlights the pervasive power of peer processes and the essential desire for belonging. Lastly, these students' linguistic environment, generally defined as code-switching between English and heritage languages, describes a multifaceted dynamic between language and cultural accommodation. Though implying hybridity and facilitating communication, this aspect also leads us to raise serious questions about the potential for linguistic erosion and its implications for cultural heritage. This research rigorously examines these linked appearances as constitutive aspects of a key socio-cultural negotiation within the specific setting of the university.

Drawing on proven sociological and psychological theory, including social identity theory, communication accommodation theory, and globalization theory, the purpose of this study is to offer a rich and analytical description of the difficulties and coping strategies encountered by students from "nouveau modern" backgrounds in adapting to higher education complexity and in building their identities in a new, evolving socio-cultural environment. The research therefore addresses critical questions such as: How do "nouveau modern" students at IIUI experience social integration within a culturally conservative context? How do they negotiate identity through their behavior, language, appearance, and social interaction? And how do symbolic behaviors and cultural hybridity influence their social mobility and sense of belonging in IIUI? Ultimately, the study adds to our understanding of social mobility, identity building, and the politics of exclusion and inclusion in modern academic environments, providing insightful contributions to the wider debate on cultural hybridity, social conformity, and the construction of identity in Pakistani higher education. It focuses on greater inclusive academic spaces that recognize and cater to socio-cultural diversity.

The context of the Study

The construction of hybrid identities among students reflects the innovative fusion of local tradition and international influences (Hall,1992). This is contrary to essentialist views of identity, highlighting the processual and dynamic character of identity in a time of globalization. The sensation of "being caught between two worlds" captures the experience of moving through cross-pressuring cultural domains. Students construct this duality as strength, in line with Bhabha's (1994) theory of hybridity and the "third space," in which blended identities are formed. This view contradicts static identifications of identity, as posited by Hall (1990), underlining its nature of fluidity in an age of globalization.

Cultural Adaptation and Social Comparison

The fact that students observed initially altering their ways of behaving and looking to fit into the social scene highlights an active approach to adjustment to a new setting. The acculturation theory (Berry, 1997) underlines such an adjustment with implications, implying a purposeful adjustment to social norms as opposed to conformity. The use of new clothing and new technology, fueled by social comparison (Festinger, 1954) and the need to be accepted by their peers (Steinberg & Monahan, 2007; Hogg, 2000), are active efforts to create membership and diminish perceived differences. The desire articulated for acceptance in terms of their current selves, and not past socio-economic status, is indicative of a quest for redefined social identity— a crucial concept in social identity theory (Tajfel & Turner, 1979)—and a repudiation of possible stigmatization (Goffman, 1963).

Experiences with Cultural Relativism and Prejudice

Judgment and stereotyping by socio-economic status indicate the ongoing difficulties in attaining true cultural relativism within the university. The sense of arrogance or alienation brought on by family wealth demonstrates the strength of social prejudice and stereotyping (Allport, 1954), based on simplistic categorization (Tajfel & Turner, 1979). This negative naming, a kind of social stigma (Goffman, 1963), is contrary to the ideals of understanding multicultural backgrounds. The identified "unspoken divide" reflects current social stratification (Kraus & Keltner, 2009), preventing genuine connections and promoting segregation. Exclusion from contributing because of assumptions regarding one's history reflects the harmful impacts of in-group bias (Allport, 1954) on fair interaction.

Symbolic Consumption and Media Influence

The embracement of symbolic consumption, more importantly through visual symbols of modernity like technology and fashion (Veblen, 1899; Baudrillard, 1998), again shows how identity is highly expressed and negotiated. Such material selections tend to be guided by global media fashions (Livingstone, 2008; McCracken, 1988), which impress on students' definitions of modernity and status. Students tend to take cues from social media (McCracken, 1988; Kim & Ko, 2012), though this is ethically problematic with regards to cultural appropriation (Scafidi, 2005; Rocamora & Smelik, 2016). Identifying brands with prestige reflects Veblen's (1899) theory of conspicuous consumption, whereby goods convey status over utility. Global technology and media serve as drivers in determining lifestyles and ambitions. The convergence of online identities with Western standards (Chou & Edge, 2012) and the widening horizons through media such as Instagram (Livingstone, 2008) exhibit the massive influence of digital media.

Peer Networks and Linguistic Blending

Peer networks have a central but multifaceted role in the formation of identity and social integration (Harris, 1995; Brown, 2007). Although common lifestyle preferences can promote cohesion, they might result in the exclusion of nonconforming individuals, revealing the strong impact of peer processes on belonging (Baumeister & Leary, 1995). Also, the linguistic behavior of such students, which involves code-switching between Urdu and English (García, 2009; Alhazmi, 2016), indicates the convergence of cultural hybridity and communication. Although it allows for social accommodation, it questions linguistic erosion and its future effect on cultural heritage (Fishman, 2001; Grosjean, 1989).

Research settings

Methods

This study adopted a qualitative research approach to comprehensively capture students' subjective experiences of dealing with social integration. This methodology was chosen because it enables a detailed examination of personal perceptions, meanings, and interpretations of integration within the university setting.

Participants and Sampling

The study population comprised 22 female students currently enrolled at the International Islamic University Islamabad (IIUI). These participants identified themselves as "nouveau

modern" students, hailing from more modern, progressive, or diversified social and cultural backgrounds, and potentially experiencing unique challenges in adjusting to the university's sociocultural setting. The sample size was determined based on data saturation principles, with a slightly more extensive sample obtained due to time and resource limitations. As the study was exploratory in nature, a non-probability sampling technique was employed. Specifically, a purposive sampling technique was used to select individuals who were most likely to provide rich and insightful perspectives on the researched phenomenon. The inclusion criteria for participants were: students who identified themselves as belonging to contemporary or new-style socio-cultural backgrounds; students currently at IIUI to ensure a culturally situated analysis; and individuals willing to openly discuss their social integration experience at IIUI.

Data Collection and Analysis

In-depth interviews were used to gather data. Then, topic analysis was used to assess the collected content. To reveal repeated themes, patterns, and sub-themes concerning the experience of social integration, the verbatim interviews' transcriptions were extensively coded. This method gave in-depth insight into IIUI's "nouveau modern" students' conception of identity and belonging in the academic environment.

Ethical Considerations

Ethical integrity was given prime importance in the course of the research process. Participants were provided with full informed consent, and this included comprehensive information regarding the reason for the study, voluntary participation, any risks, and confidentiality protection. In order to maintain anonymity, pseudonyms were employed in the data during the study, and all identifiable personal information was deleted during the analysis period. Participants were also clearly told that they were free to withdraw from the study at any moment and without penalty. With the possibility of emotional sensitiveness in answering issues regarding identity, membership, or exclusion, the researcher ensured the interviews were conducted in a safe and sensitive environment. Moreover, information regarding counseling services was provided to participants in case of any emotional struggle after the discussions.

Research results and discussion

The research findings reveal the fine-grained socio-cultural negotiations that "nouveau modern" IIUI students perform in negotiating between the conflicting demands of institutional norms, peer cultures, and self-declared identity projects. The research illuminates in stark detail how students employ strategic adaptation, hybrid identity construction, and symbolic consumption in order to negotiate membership in a conservative academic environment.

Managing Cultural Adaptation

As per research, students who belong to "nouveau modern" backgrounds purposefully adjust their behavior, dressing, and style of communication to become socially integrated in IIUI. One student described such adjustment process as below: *"When I first came here, I noticed that people were dressing more modernly. I began dressing more contemporary so that I might feel more attached to people"*. This response indicates the strategic nature of acculturation, wherein students deliberately modify visible markers of identity to fit perceived institutional norms (Berry, 1997). Pressure to fit in is not limited to apparel but also extends to material items, as indicated by another respondent: *"At first, I felt somewhat odd with my phone. Everybody had the newest ones, so I ultimately decided to upgrade so that I would not feel as odd"*. Such conduct represents the application of social comparison theory (Festinger, 1954) in real-life peer interactions, whereby individuals use material items as markers of group membership.

The psychological facets of such an adaptation arise from participants' accounts of self-presentation. One student observed: *"I've certainly learned to pay closer attention to how I*

communicate and what I say in order to stay out of trouble". This strategic self-monitoring (Snyder, 1974) illustrates the mental effort involved in managing socio-cultural differences, especially communication styles. The imposer's strategic adaptation of self-presentation fits with theory of communication accommodation (Giles, Coupland, & Coupland, 1991), in which linguistic convergence is used as a social approbation strategy. Notably, however, these adjustments are not superficial but involve what one respondent characterized as *"being accepted for who I am now, without my background being a constant point of discussion or judgment"*, a moving articulation of the wish to get beyond ascribed social categories (Tajfel & Turner, 1979) and stigmatization (Goffman, 1963).

Experiences with Cultural Relativism

The evidence exposes entrenched socio-economic prejudices that make integration difficult. Several participants recounted being subjected to discriminatory assumptions, with one of them reporting: *"I've certainly felt that some people assume I'm arrogant or out of touch just because of my family's wealth"*. This instance illustrates the triggering of negative stereotypes (Allport, 1954) on the basis of perceived class position, where economic advantage serves as a sign of moral failing. The institutional expression of these biases produces what another participant described as *"an unspoken divide between students who are seen as 'rich' and those who aren't,"* mirroring the micro-level functioning of social stratification (Kraus & Keltner, 2009) in academic contexts.

These perceptions have implications for scholarly engagement, with one respondent clarifying: *"I've had experiences where my ideas or opinions in class were ignored, and I sensed it was due to people making assumptions about where I came from"*. This testimony illustrates how in-group bias (Tajfel & Turner, 1979) limits intellectual discourse when contributions by out-group members are invalidated on the basis of socio-economic signifiers. The annoyance with this type of generalization was expressed by another participant: *"It irks me when individuals make general statements concerning individuals who hail from wealthy families"*. Every individual's experiences are unique, "This observation highlights the conflict between categorical thinking (Allport, 1954) and complicated individual realities which are resistant to overly simplistic socio-economic categorization".

Hybrid Identity and Cultural Displacement

Members expressed intricate negotiations of identity that correspond to the theoretical notion of the "third space" (Bhabha, 1994). One of the respondents spoke about feeling *"Between two worlds attracted to the liberty and individuality available through global cultural currents, yet constrained by the deeply ingrained expectation of Pakistani society"*. This borderland creates what the participant defined as "confusion and a split identity," demonstrating the psychological burden of cultural hybridization when conflicting value systems are unresolved. The experience of the respondent reflects the identity struggles that are documented in postcolonial literature, especially Mohsin Hamid's portrayal of flexible identities in globalized environments.

In contrast, a few of the participants constructed hybridity as a self-empowering strategy. As one of the students described: *"Instead of viewing it as a conflict, I see it as a way of building a special, hybrid identity that respects my cultural heritage but connects with international views"*. This positive reconstruction of the self-corresponds to Hall's (1990) theoretical construction of identity as an ongoing process and not an inherent entity. The participants' account registers agency in the formation of identity, such that the "pull between tradition and modernity" is instead "an active space for self-definition" and not one of anxiety.

Visual Modernity and Symbolic Consumption

Fashion proved a major context of identity negotiation, with participants showing differing degrees of critical reflexivity with regard to consumption practices. One respondent mentioned uncritical take-up: *"Social media is my first port of call for fashion inspiration. I hardly ever think about the deeper cultural meanings in the brands that I follow"*. This account

represents McCracken's (1988) theory of meaning transfer, in which products gain culture as they are represented through advertising and the mass media. The subject's emphasis on "projecting modernity and social prestige" via dress decisions is consistent with Veblen's (1899) original construction of conspicuous consumption as status display.

Other participants had more reflexive consumption tendencies. As another respondent commented: *"I'm becoming more conscious of the ways in which brands can take on cultural references without naming them. More education is required to instill greater cultural awareness in fashion consumption"*. This consciousness of cultural appropriation (Scafidi, 2005) infers learning critical media literacy, yet the participant admitted still engaging in trend consumerism. The conflict between aesthetic desire and ethical consideration parallels wider concerns in fashion studies regarding the potentiality of ethical consumption within capitalism.

Technology, Media Influence, and Western Ideals

The disruptive effect of digital media on identity creation arose predictably throughout interviews. One respondent mentioned extensive media influence: *"My lifestyle and fashion choices are greatly affected by social media, particularly Western influencer content, which I equate with global relevance and modernity"*. This quote reflects what Chou and Edge (2012) refer to as internalized mediated ideals, whereby constant exposure redefines personal style and desire. The subject's connection of Western content to "modernity" certainly indicates the symbolic power of Western cultural exports in postcolonial environments to last. The vast possibilities of digital spaces were observed by another respondent: *"Spaces like Instagram and YouTube have opened up my world, enabling me to sample styles and behaviors I would not have experienced otherwise"*. This is paralleled by Livingstone's (2008) description of digital media as windows to different identities and ways of life. But the interviewee's account also suggests a displacement of national cultural references by globalized digital content—a process with mixed implications for preserving culture in the digital era.

Peer Networks and Lifestyle-Based Grouping

Social patterns of affiliation indicated lifestyle-driven tribalism in students. One participant noted: *"Friend groups in our college tend to be based on common lifestyle choices, for example, fashion, gadgets, and being on social media"*. This transition from conventional kinship or geographical affiliations to consumption-driven affiliations is mirrored in wider global youth culture (Brown, 2007). The students observed this made it challenging "for those with more conventional tastes to fit in," demonstrating how taste as a process becomes a tool of social exclusion and inclusion (Bourdieu, 1984). The affective impact of non-conformity was poignantly illustrated by another respondent: *"I've felt like I've been left out in social situations because I don't keep up with the current trends or go to trendy events, and it's made me feel isolated"*. Such an experience confirms Baumeister and Leary's (1995) theory of our fundamental human need to belong, revealing how emerging youth cultures organize consumption patterns as membership qualifications in society. The confinement of the participant accentuates psychological costs when institution spaces are unable to develop inclusive social infrastructures over commercialized peer cultures.

Linguistic Blending and Cultural Hybridity

The language practice of members proved complex negotiations of cultural identity. One interviewee explained typical code-switching: *"Using English is generally being thought well educated and modern"*. Such an impression is in line with Alhazmi's (2016) research on English as a cosmopolitan marker of identity in multilingual discourse. But the informant also admitted *"having difficulty describing fully intricate ideas in either language,"* explaining Grosjean's (1989) semilingualism by excessive code-switching. Another commentator provided generational concerns: *"Repeated code-switching is resulting in progressive loss of mother language skills among new generation"*. This posting is aligned with Fishman's (2001) cautions regarding language shift, whereby prestige languages surround heritage

languages in informal contexts. The ambivalence of the author to the acknowledgment of English's social capital and lamenting the erasure of Urdu represents the postcolonial multilingualism's contradictory nature, wherein linguistic mix is a motivation for communication but an obstacle to language transmission from one generation to the next.

Negotiating Tradition and Modernity

Language use by participants also showed complex negotiations of cultural identity. One participant clarified common code-switching: "Using English usually being seen as well-educated and modern." This account is in line with Alhazmi's (2016) study of English as a cosmopolitan sign of identity in multilingual communication. The respondent, however, also admitted "struggling to explain fully complicated ideas in either language," explaining Grosjean's (1989) semilingualism phenomenon of excessive code switching. One of the commenters had generational grievances: "Repeated code-switching is causing gradual loss of mother language skills among new generation". This comment aligns with Fishman's (2001) alerts regarding language shift, where prestige language envelops heritage languages in casual contexts. The writer's hesitation to acknowledge English's social capital and lament the loss of Urdu reflects the conflicting nature of postcolonial multilingualism, where linguistic blending is a catalyst for communication but a barrier to language transmission from one generation to the next.

Discussion

The consequences of this research illuminate the subtle socio-cultural bargaining that "nouveau modern" students at IIUI engage in as they construct and negotiate the conflicting expectations of institutional norms, peer cultures, and their own identity projects. The study graphically accounts for how these students employ strategic adaptation, hybrid identity construction, and symbolic consumption as means to negotiate a sense of belonging in a culturally conservative academic environment. One overriding dynamic that is apparent is the tension between conformity to external forces and negotiation of individual authenticity. Students strategically term their behavior, appearance, and communication styles in order to minimize social distance as they attempt to preserve their authentic identity. Yet these moves are frequently undermined by entrenched socio-economic prejudices, whereby class-based stereotypes result in only partial inclusion within the university environment. Members often described being subjected to discriminatory presumption and experiencing an "unspoken divide" due to perceived family affluence, which discouraged the creation of authentic relationships and even resulted in their concepts being disallowed in scholarly discussions. This illustrates how in-group prejudice and oversimplified categorization can contribute to unjust interaction and create social segregation.

The complex negotiations of identity among students often map onto the theoretical construct of a "third space" (Bhabha, 1994). Whereas some students reported feeling "between two worlds," torn and suffering from a "split identity" because of unresolved conflicting value systems, other students rearticulated this hybridity as an empowering strategy. This constructive re-interpretation is in harmony with Hall's (1990) perspective on identity as a continuous, dynamic process and not a fixed state, reflecting agency in defining oneself in the face of tension between tradition and modernity.

Material culture, particularly technology and fashion, serves as a significant arena for identity work. While some participants exhibited an uncritical adoption of trends, primarily influenced by social media and geared towards "projecting modernity and social prestige" (consistent with Veblen's (1899) conspicuous consumption), others demonstrated a more reflexive awareness of cultural appropriation. This conflict between aesthetic desire and ethical consideration mirrors broader concerns within fashion studies. Digital media, driven by Western influencer content, profoundly shapes lifestyle and fashion choices, often equated with global relevance and modernity. This constant exposure contributes to internalized mediated ideals (Chou & Edge, 2012) and broadens horizons (Livingstone, 2008), though it

also suggests a potential displacement of national cultural references by globalized digital content.

Peer networks are increasingly structured around lifestyle markers such as fashion, gadgets, and social media presence, rather than conventional affiliations. This lifestyle-driven tribalism can create new pathways for belonging but concurrently generates new forms of exclusion, making it challenging for those with more conventional tastes to integrate. The affective impact of non-conformity, leading to feelings of social isolation, powerfully confirms the fundamental human need to belong (Baumeister & Leary, 1995) and highlights the psychological costs incurred when institutional spaces fail to foster inclusive social infrastructures over commercialized peer cultures.

Linguistic blending, specifically code-switching between English and Urdu, reveals the micro-process of cultural transformation. While using English is often perceived as a sign of being "well-educated and modern" (Alhazmi, 2016) and facilitates communication, participants also expressed struggling to fully articulate complex ideas in either language, consistent with Grosjean's (1989) concept of semilingualism. Concerns were also raised about a gradual loss of mother language skills among the younger generation, resonating with Fishman's (2001) warnings about language shift. This postcolonial multilingualism paradox highlights how linguistic hybridity, although facilitating communication, may be compromising linguistic depth and intergenerational transmission.

Throughout all these spheres, learners are constantly negotiating between tradition and the modern world, creating individual strategies for negotiating global aspirations and cultural continuity. This negotiation tends to be in the form of "selective modernization" a conscious uptake of global norms but preservation of core traditional values and is a testament to an agential nature that refutes narratives of passive Westernization in global youth cultures. These findings directly feed into broader theoretical discussions about the formation of identities in globalizing societies. The study finally determines that there is an evident need for institutional policy to help advance socio-cultural diversity and proactively attempt to minimize the exclusionary effects of class-based prejudice and commercialized peer cultures within university campuses.

Conclusion

This research sheds light on the intricate socio-cultural negotiations made by "nouveau modern" female students at IIUI as they negotiate between contradictory demands of institutional expectations, peer cultures, and their developing identities. Our results show that these students utilize strategic adaptation, develop hybrid identities, and practice symbolic consumption to construct a sense of belongingness within a culturally conservative higher education setting. The central dynamic seen is an ongoing tension between conformity to society and the articulation of true self, usually complicated by deeply held socio-economic prejudices that prevent complete inclusion. The study highlights the ways cultural hybridity, brought about by global media and lifestyle-centered peer networks, informs identity construction and social relations. As enabling communication, code switching provokes very serious questions regarding language preservation. Ultimately, these students are actively navigating tradition and modernity, giving evidence of an agential method of balancing global dreams with cultural continuity. This research provides a major contribution to learning about the formation of identity, social mobility, and the processes of inclusion and exclusion in the contexts of globalizing universities, and uncompromisingly promotes institutional policy supporting socio-cultural diversity and actively combating class bias and commercialized peer culture.
